Denne boken gir vassføring i tall og diagram for 69 vannmerker. Ved utvelgelsen har vi forsøkt å etterkomme ønsker om geografisk distribusjon og om en rimelig fordeling av både små og store felt. Vi har lagt an på ikke å ta med for mange vannmerker, og vi har forsøkt å velge ut stasjoner med relativt ukomplisert databearbeidelse.

Vi har i boken i størst mulig utstrekning forsøkt å illustrere de naturlige forhold, og vi har av den grunn få vannmerker fra regulerte vassdrag. Disse er bare tatt med der vi mener det er nødvendig for oversiktens skyld, og vassføringen er da gitt slik den er observert. Vi har således ikke korrigert for reguleringers innvirkning eller forsøkt å rekonstruere de vassføringer vi ville ha hatt ved uregulerte forhold.

Vi har forsøkt å illustrere årets vassføringsforhold i relasjon til midlere og ekstreme tilstander. Alle tabeller og diagram er offsettrykk av EDB-utskrifter.

HYDROLOGISK OVERSIKT FOR ÅRET 1976

Det kom uvanlig store snømengder i høyfjellet. I Sør-Norge var det særlig de vestlige fjellstrøk som fikk de store nedbørmengder. I Trøndelag var snømengdene 2-3 gang det normale. Også i Nordland og Troms var snømengdene langt over det vanlige. I Finnmark var forholdene stort sett som i et middels år.

På Østlandet og Sørlandet var det lite snø, tildels langt under det normale. Utsiktene til vårflom av noen størrelse var derfor svært liten i disse landsdeler.

I vest og nord var derimot mulighetene for storflom i høy grad tilstede, særlig i Trøndelag. I Gaulas og Orklas nedbørfelter var snømengdene særlig store.

I Trøndelagsdistriktene ble det storflom som også tildels medførte merkbare skader. Takket være en gunstig værutvikling med lite nedbør og forholdsvis kalde netter i flomperioden ble det likevel ingen katastrofeflom. I stedet ble det en relativt lang avsmeltingsperiode.

I de lavere strøk av Østlandet og på Sørlandet ble flommene minimale. Snømengdene var som nevnt små, og det ble lite nedbør utover våren. Denne tørre værtype fortsatte også i hele sommerhalvåret i disse landsdelene, med rekordlave nedbørstall og utpreget tørke. Elver og vannkilder tørket ut og flere steder var tilsiget det lavest som hittil har vært observert.

I oktober slo været om. På Sørlandet ble det reigstrert nye nedbørsrekorder. Dette sammen med snøsmelting førte til betydelige skadeflommer. Også Østlandet fikk nedbørmengder over det normale. I løpet av høsten kom det så mye nedbør at årssummen svarte til nedbørmengdene i et normalår for disse landsdeler.

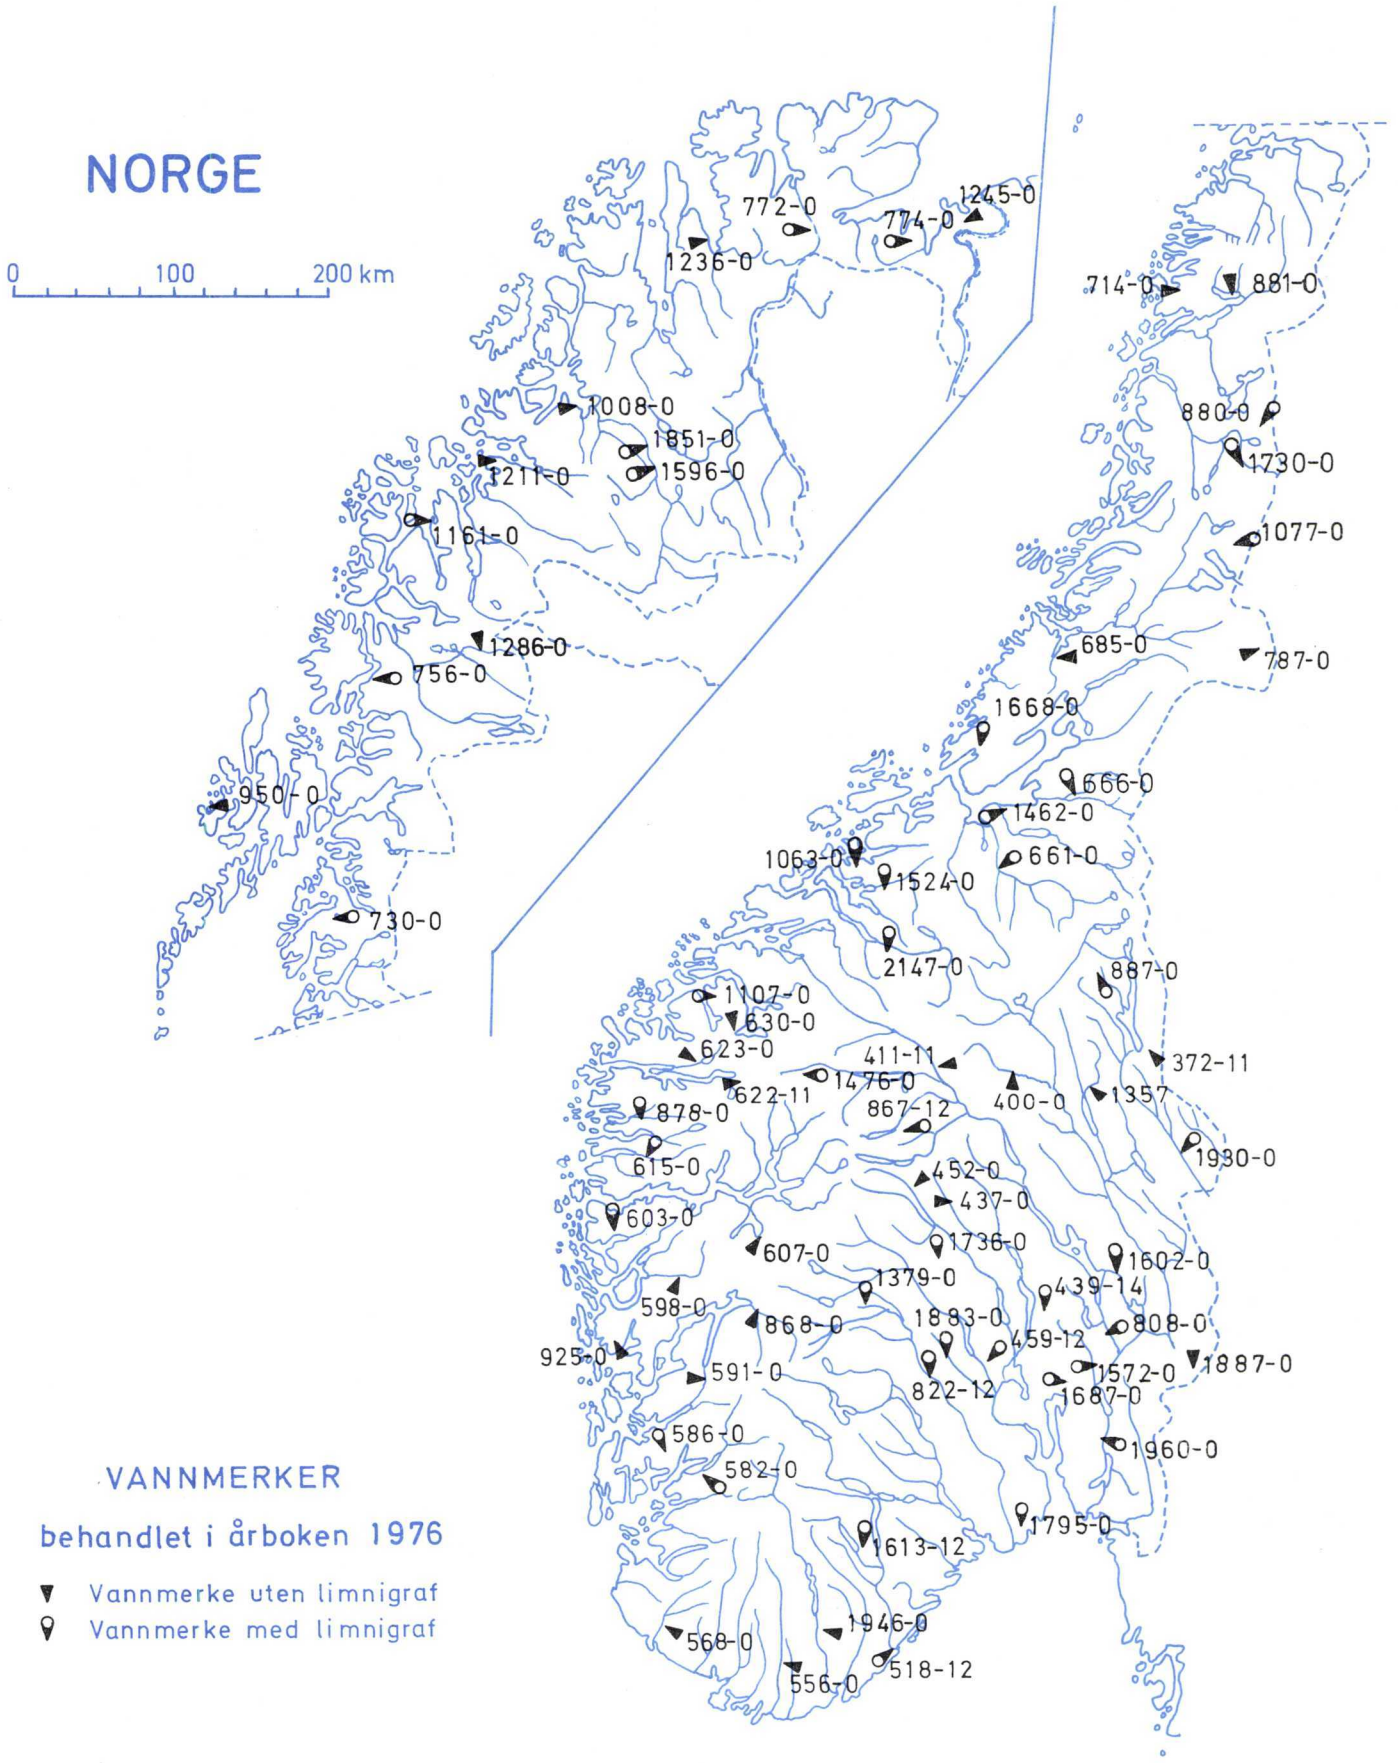

På Vestlandet og i Trøndelag var det også en forholdsvis tørr sommer, selv om den ikke ble så ekstrem som for Øst- og Sørlandet. Tilgjengjeld ble det en unormal tørr høst med svært lite tilsig i vassdragene, særlig på Vestlandet.

I Nord-Norge var det en fuktig sommer. Høsten derimot var relativt tørr.

Vannmerkeregister ordnet geografisk.

VANNMERKER

behandlet i årboken 1976

▼ Vannmerke uten limnigraf

▼ Vannmerke med limnigraf

SPESIELLE MERKNADER

Enkelte vannmerker med lang observasjonsperiode er blitt nedlagt som avløpsmerker.

I noen tilfeller er det opprettet et nytt avløpsmerke i nærheten, eller det har vært mulig å skaffe vassføringsdata på annet vis (avløp gjennom kraftstasjoner). I de tilfellene der det har vært ønskelig å benytte slike stasjoner i vassføringsårboken har en i referanseperioden benyttet data fra det gamle vannmerket.
Dette gjelder følgende vannmerker:

Gammelt vannmerke		Nytt vannmerke	
395-0	Langnes	1960-0	Solbergfoss
538-12	Byglandsfjord	1946-0	Syrtveit
411-12	Lårgård bru	411-11	Rosten
680-0	Rødsjø	1668-0	Krinsvatn
373-0	Nybergsund	1930-0	Nybergsund
380-11	Magnor	1887-0	Magnor
380-12	"	1887-0	"
1738-0	"	1887-0	"

Følgende vannmerker har observasjonsbrudd i referanseperioden:

Vannmerke	Observasjonsbrudd	
	fra	til
867-12	Jan. 1951	Okt. 1964
720-0	Sep. 1960	Mai 1962
772-0	Jun. 1944	Feb. 1964

FORKLARING TIL TABELLENE OG FIGURENE

Hvert vannmerke er behandlet over to påfølgende sider med tabellene på høyre side og figurene på venstre side.

a. TABELLENE

Enhet

Enheten for vassføring er i alle tabellene m^3/s (angitt som M3/S).
Enheten for feltareal er km^2 (angitt som KM2).

Inndeling

Tabellen øverst på siden angir døgnmiddel for isreduserte og kompletterte vassføringer. Under tabellen er det angitt endel karakteristiske data for de enkelte måneder og året.

Neste tabell angir så de tilsvarende pentademidler (5-døgnsmiddel).

Tabellen nederst på siden angir karakteristiske verdier for måneder og det hydrologiske år (1/9-31/8) for en lengre referanseperiode.

Vannmerkets navn, nummer og kode

Vannmerkets navn, nummer og kode er anført over tabellene. Kodetallet brukes til å skille mellom vannmerker som har fått samme nummer (eks. vannmerker ovenfor og nedenfor en reguleringsdam).

Vassdrag og elv

Hovedvassdragets navn er alltid oppgitt, og man har forsøkt å holde seg til vassdragets navn ved utløpet i havet. Ligger vannmerket i et sidevassdrag, er navnet på elven oppført under hovedvassdraget.

Uregulert - regulert

Dersom vassføringen ved vannmerket ikke er påvirket av regulering i vassdraget er det anført uregulert over tabellene. I motsatt fall er det anført regulert.

Geografiske koordinater

Geografisk lengde er gitt i forhold til Greenwich meridian.

Feltareal

Nedbørfeltets areal er angitt ved sin naturlige størrelse. Forekommer overføring til eller fra feltet er dette markert ved en stjerne etter feltstørrelsen (eks. FELTAREAL: 1723 KM2*).

Tabell for døgnmiddel

Døgnmiddel representerer middelvassføring i døgnet. Dataene er korrigert for isoppstuing og komplettert der dette har vært nødvendig. Vassføringer fremkommet på denne måte er avmerket med stjerne.

Under tabellen er anført middel og ekstremverdier for hver måned. Ekstremene innen året er spesielt angitt med dato.

Videre er middel for kalenderåret og det siste hydrologiske år oppført, samt månedlige ekstremverdier for referanseperioden.

Tabell for pentademiddel

Pentade nr. 1 gir middelvassføring for perioden 1/1-5/1, pentade nr. 2 gir middelvassføring for perioden 6/1-10/1, osv. Hele året er således oppdelt i 73 pentader. (Observasjoner 29. februar blir ikke benyttet).

Tabell for karakteristiske verdier

Her er oppført karakteristiske middelverdier for hver måned og det hydrologiske år over en lengre referanseperiode. Det gjøres oppmerksom på at midlet av de månedlige minima eller maksima normalt ikke vil være lik tilsvarende verdier for det hydrologiske år. Dette skyldes at de månedlige ekstremer ikke vil forekomme innen det samme år. Som referanseperiode er valgt en periode hvor det ikke har forekommet vesentlige reguleringer som har endret vassføringen ved vannmerket. For vannmerker som fram til i dag ikke er påvirket av regulering, er referanseperioden normalt valgt fra første hele observasjonsår etter opprettelsesdatoen. Eventuelle brudd i observasjonsperioden er ikke tatt hensyn til. Disse brudd er angitt under avsnittet "Spesielle merknader".

Observasjoner fra siste år er ikke tatt med i beregningen av referansedata.

b. FIGURENE

Den øverste figur viser et stolpediagram av døgnvassføringene i det aktuelle observasjonsområde.

På figuren er også inntegnet 5 kurver. De 4 kurvene som begynner øverst til

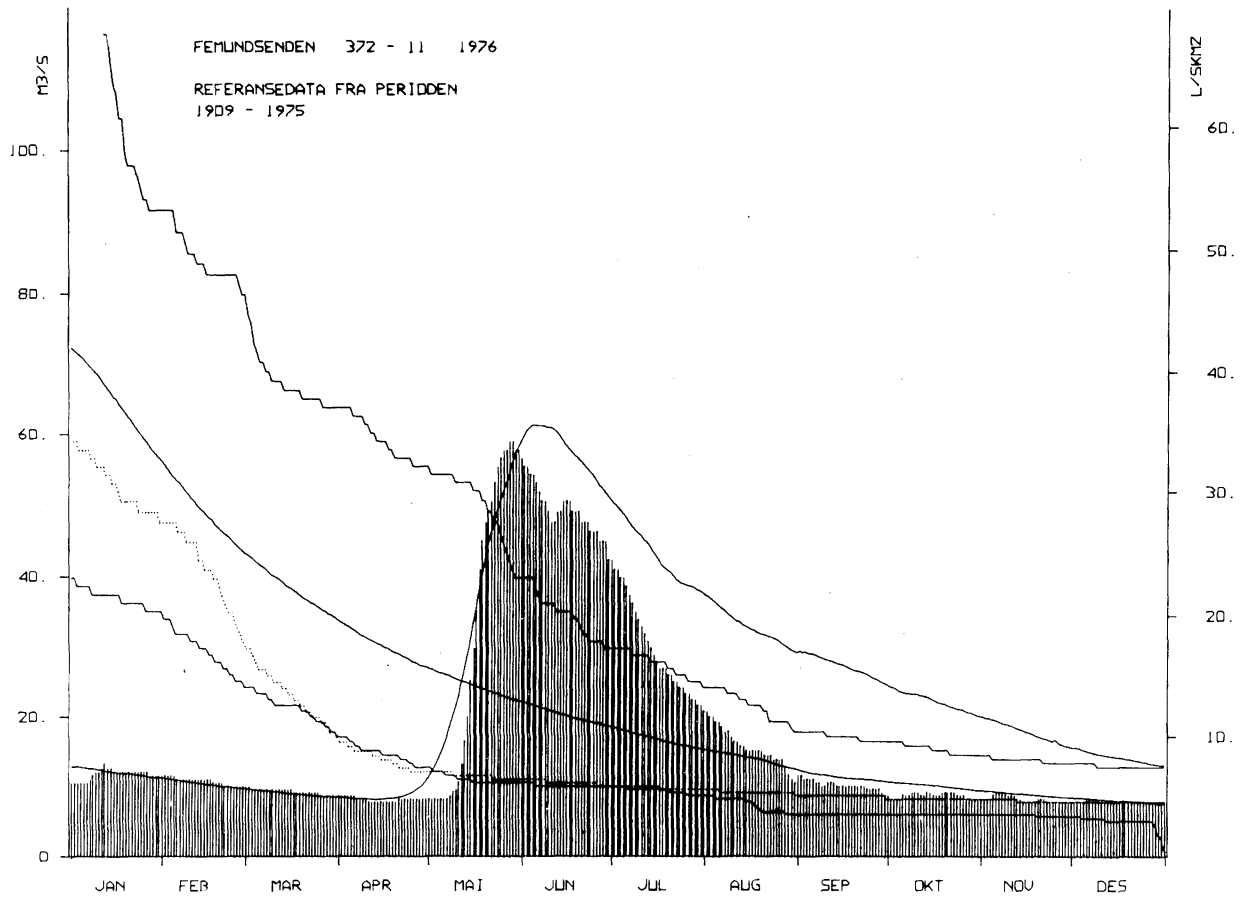

venstre og avtar mot høyre er varighetskurver. Den mellomliggende, heltrukne kurve representerer varighetskurven for middelvassføringene i referanseperioden. De 2 øvrige heltrukne kurvene representerer ekstremverdiene i samme periode. Den stiplede kurven er varighetskurven for det angjeldende år.

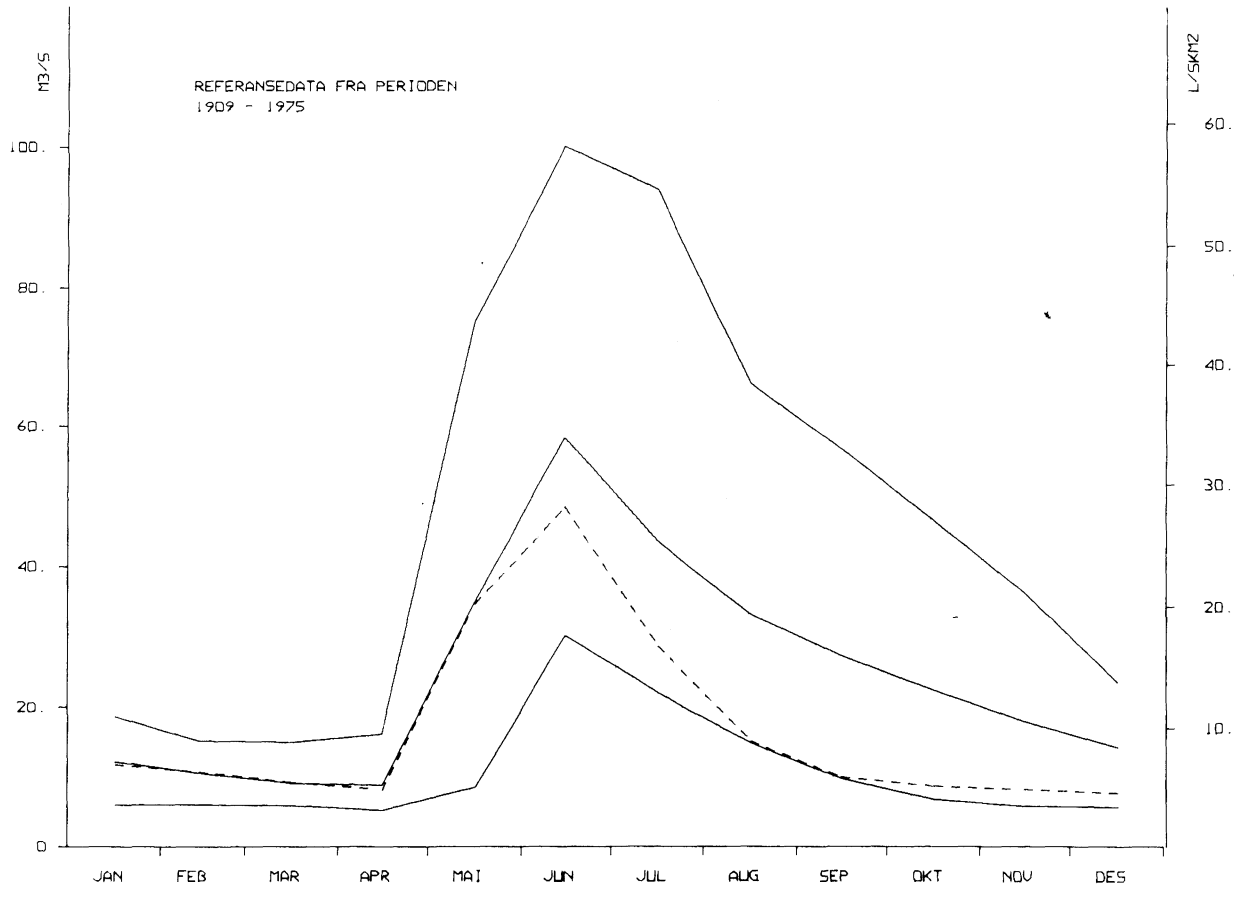

Varighetskurvene er beregnet ved at døgnvassføringene hvert kalenderår er sortert i synkende rekkefølge. Tidsskalaen starter derfor på 1 og slutter på 365 (eller 0 til 100%).

Den femte kurve er en grafisk fremstilling av midlere vassføring i den anvendte referanseperiode.

Den nederste figur er en grafisk fremstilling av månedsverdiene i tabellen nederst på etterfølgende side. Referanseperiodens verdier er heltrukne kurver (middel, maks, og min.). Den stiplede kurven er årets månedsmidler.

Enheten på ordinatskalaen til venstre på figuren er m^3/s (M3/S) og til høyre $l/s.km^2$ (L/S KM2).
